

ABSTRACT

A server receives a call sign from a client terminal CT to identify a currently received radio station RS. There is provided state information which indicates states of an information provision service associated with the radio station RS corresponding to the call sign. At least when the information provision service is available, the server sends the state information as well as a URL corresponding to the information provision service to the client terminal CT. In this manner, the client terminal CT can be provided with not only the state information indicative of states of the information provision service associated with the radio station RS, but also the URL corresponding to the information provision service. A user can be clearly notified of service states of an information provision service prior to access to the information provision service.
